

X-ray Tomography. collaboration, perspectives, visions?

Markku Kataja

X-ray Tomography Laboratory,
University of Jyväskylä, Department of Physics

University of Jyväskylä, Department of physics (JYFL)

Main fields of research:

- **Subatomic physics**
 - Nuclear physics (Accelerator laboratory)
 - Particle physics and cosmology
- **Materials physics**
 - Nanophysics (Nanoscience centre)
 - Complex materials (X-ray tomography lab.)

JYFL X-ray Tomography Laboratory. Facilities

1. Zeiss Xradia multiscale equipment.

- Micro/nanotomography
- Resolution 30 μm - 50 nm
- Sample size 40 mm - 15 μm

Vipuvoimaa
EU:lta
2007-2013

LÄNSI-SUOMEN
LÄÄNINHALLITUS

JYFL X-ray Tomography Laboratory. Facilities

2. SkyScan 1172 table-top scanner.

- Resolution 30 μm - 5 μm
- Sample size 50 mm - 2 mm
- 10 MB camera

Facilities

3. Sample preparation equipment

Precision laser machining tool

Stereo microscope with micromanipulators

Vipuvoimaa
EU:lta
2007-2013

LÄNSI-SUOMEN
LÄÄNINHALLITUS

Facilities

4. Sample conditioning equipment

Mechanical sample straining unit

Humidity controller

Vipuvoimaa
EU:lta
2007-2013

LÄNSI-SUOMEN
LÄÄNINHALLITUS

Research profile: Complex materials group

X-Ray tomographic imaging and image analysis

- Non-destructive 3D imaging of material samples even in nm scale
- Structure and transport phenomena of heterogeneous materials
- Image analysis methods development

Heterogeneous materials research

- Structural properties
- Transport properties (4D imaging)
- Composites, biological materials, geological materials,...
- Hydromechanical behaviour of bentonite

Modelling and simulation

- Flow in porous media
- Transport phenomena
- Multiphase flows

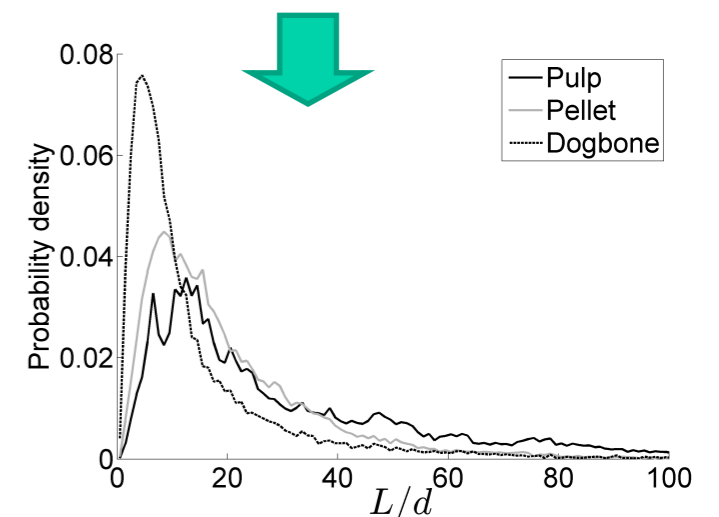

Industrial applications

- Bio-based composites
- Strength, fracture and barrier properties of various materials

Methods development at JYFL:

General goal: Quantitative measurement of heterogeneous materials properties based on 3D tomographic images.

- Image reconstruction
 - Filtered back-projection - and beyond
- Image post-processing
 - Denoising
 - Artefact removal
- 3D image analysis
 - Structural characteristics (porosity, surface area,...)
 - Pattern recognition (particles, fibres, single pores,...)
 - Orientation, skeletonization,...
 - ...
- Numerical simulations based on true structure
 - Flow properties in porous media
 - Orientation, skeletonization,...
 - ...
- 4D tomography
 - Monitoring temporal change of internal structure
 - E.g.: water transport and deformations in wetting/swelling medium

Nanotomography

X-ray source
A copper anode,
characteristic peak of 8 keV.

Pinhole
Used to exclude multiple
reflected light.

Sample
At focal
point

Phase ring
To block direct light (not diffracted
by the sample) and to generate
zernike phase contrast image.

Condenser
An elliptical capillary lens
used to focus X-rays into
the sample.

Objective Zone plate
Another focusing optics (Fresnel zone
plate) to focus the image onto detector.

Flight tube and detector
He gas filled tube used to
channel X-rays to the
detector (CCD chip coupled
with a scintillator)

XnCT example: contact between two wood fibres

Sample preparation using micromanipulators and laser cutting

Sample ready for scanning

Nano-CT image of the contact

Contact area analysed

Collaborative opportunities

General perspective (FinTomo network)

- Joint research projects
 - E.g. participation in EU projects
 - Joint infrastructure projects
 - FIRI, EU,...
 - Subcontracting
 - Role as an external service provider in public or industrial projects.
 - Sheared resources:
 - Facilities (device time)
 - Expertise
 - Knowledge
 - Researcher training
 - PhD student exchange,
 - Summerschools,
 - Mobility
 - Post-doctoral researcher exchange
- ... etc.

Practical example of GTK-JYFL collaboration: Geological samples imaged with nano-CT.

- FOV 60 μm , Pixel size 65 nm, Resolution 150 nm

Biotite

Cordierite

Feldspar

Tomographic art

Wood fibres in a composite material

Tracheids of wood

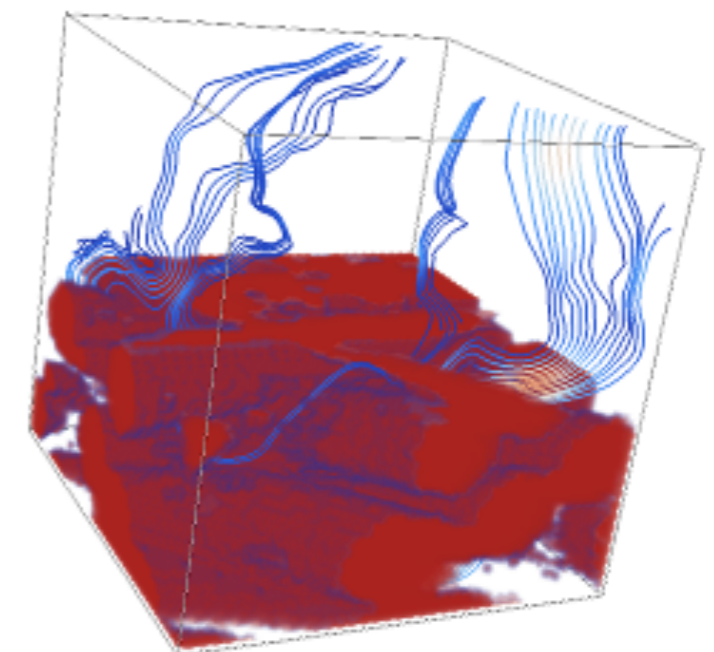

Pore space of a felt segmented into individual pores.

Internal structure of cardboard

Numerically solved flowlines in porous material

Minerals in cordierite
